

ILLINOIS AGRICULTURAL STATISTICS

Annual Summary - 1984

Bulletin 84 - 1

CROP REPORTING DISTRICTS

For statistical purposes the counties of Illinois are grouped into nine Crop Reporting Districts (shown on the map at right). These groupings represent divisions of approximately equal size with similar soils, growing conditions and types of farming.

Crop Reporting Districts are used in the compilation of most reports. It is not possible to collect sufficient data for each county to make county estimates on a timely basis. It is possible to summarize data at a district level and weight districts together by production percentages to arrive at the best State estimates.

Many data series in this bulletin present estimates for Crop Reporting Districts. Some series are further broken down into county estimates within districts.

State of Illinois DEPARTMENT OF AGRICULTURE

Office of the Director

Agriculture Building, State Fairgrounds, Springfield 62706-1001, 217/782-2172

Dear Friend:

Contained in these pages is the documentation of a tremendous effort on the part of nearly 100,000 farm families and the complex network of agricultural support industries which join together to make Illinois one of the greatest agriculture states in the Nation. As in past years, the 1984 edition of Illinois Agricultural Statistics has been compiled by the Federal-State Agricultural Reporting Service.

I often refer to this valuable publication for information regarding a variety of agriculture topics. This provides a unique opportunity for others to appreciate the ways in which agriculture benefits the State of Illinois. It is available to all and I hope you will utilize it as a tool in whatever area of the agriculture sector with which you are involved.

I would like to express my personal thanks to the many farmers and agribusinesses who voluntarily take the time to provide the data for this publication by reporting on numerous agricultural surveys. It is only through their continued cooperation that accurate, current, and useful crop and livestock statistics can be assimilated and published.

Sincerely,

A handwritten signature in cursive script that reads "Larry A. Werries". The signature is written in dark ink and is positioned below the word "Sincerely,".

Larry A. Werries

(217) 492-4295

Dear Friend:

This publication is the result of continuing cooperation between Illinois farmers and agribusinesses, the Illinois Department of Agriculture and the Statistical Reporting Service of the U.S. Department of Agriculture. It provides official estimates of agricultural production, prices and related data with comparisons back to 1975.

Illinois agriculturists will long remember the year 1983, a year when government farm programs diverted approximately 4.9 million acres of Illinois cropland from production to conservation use while severe drought and heat drastically reduced crop yields and disrupted livestock production. On top of the severe production losses, the entire agricultural industry suffered through tough economic woes.

The Illinois farmer has been working hard to keep ahead of rising production costs and changing patterns of supply and demand. To accomplish this feat farmers must have reliable information on which planning and marketing decisions can be based. This book summarizes the agricultural information that is compiled by the Illinois Cooperative Crop Reporting Service and made available throughout the year in the form of weekly, monthly and quarterly reports.

Although we strive to make sure our survey procedures are scientifically sound and our estimates are timely and accurate, these goals are achievable only through the cooperation of thousands of farmers and agribusinesses, that voluntarily provide the basic information. To these people we owe a special "THANK YOU." The help of county extension advisers and other county USDA agencies is also appreciated. In addition, we owe a special thanks to our field enumerators, telephone enumerators, and the members of the office who conducted the survey, evaluated the results and established the estimates presented in this publication.

Assembling this publication is an immense and ongoing task. The responsibility rests with Garry Kepley, Assistant Statistician in Charge, and Cathy Werner, Supervisory Statistical Assistant. A special thanks also goes to June Carter and Agnes Chrans for doing the typing and the print shop personnel for the outstanding job of printing and binding.

Sincerely,

Fred S. Barrett
Agricultural Statistician in Charge

ILLINOIS AGRICULTURE

The State of Illinois is blessed with some of the richest agricultural resources in the USA and in the world. Illinois farmers and industries produce abundant supplies of foods and agricultural products that have gained acceptance worldwide.

Illinois lies midway between the Continental Divide and the Atlantic Ocean and some 500 miles north of the Gulf of Mexico. The climate is typically continental with cold winters, warm summers, and frequent short period fluctuations of temperature, humidity, cloudiness and wind direction. The excellent soil and well distributed annual precipitation favor a very high standard of agricultural production.

Agriculture in Illinois has been 150,000 years in the making. During the Ice Age glaciers moved across the continent, leveling the countryside and depositing black, fertile soil over much of the state. These black soils, rich in organic content, yield an agricultural productivity that is unsurpassed. Parts of Illinois untouched by glacial movement reveal hills and valleys bedecked with timber, haystacks and grazing livestock.

Well known as the home of Abraham Lincoln, the state of Illinois has developed a highly diversified economy. America's third largest city, Chicago, lies adjacent to the Great Lakes region in northern Illinois. Beyond the urban industrial areas, there were 96,000 farms in 1984 with more than 28 million acres of fertile farmland which comprises Illinois' largest industry, agriculture.

The variation in soil types, climate and topography make it possible for Illinois farmers to grow a wide variety of crops. Processing vegetables are grown in the northeast, apples and peaches on the ridges where air movement is good, and corn, soybeans, wheat and hay in all parts of the state. Fresh market vegetables, popcorn, potatoes, horseradish and pumpkins are other crops which are grown commercially in Illinois.

Although many farms in the State have become specialized for the production of crops such as corn and soybeans, there are still 47,000 farms that have cattle; 25,000 farms have hogs; 7,400 have sheep; 6,100 have milk cows; and 6,700 have poultry. Cattle are found throughout the state but populations are most concentrated in the Northwest. Milk cow numbers are concentrated in the North and Southwest. Hogs and pigs are on farms throughout the state but the largest populations are in the Western and Northwestern areas of the state. Livestock production contributes nearly a third of the total cash receipts from Illinois farms.

Food and agricultural product processing contribute significantly to the state's economy. Illinois is one of the top ranking states in meat packing, soybean processing, dairy manufacturing, corn processing, feed milling, and vegetable processing.

Illinois' fertile soil, favorable climate, availability of good transportation and the industry of its people make it a rich agricultural empire.

FARM INCOME

Corn and soybeans provided over two-thirds of the total cash receipts to Illinois farmers in 1983. Corn sales accounted for 43% of the total cash receipts, up from 38% in 1982. Even though corn production was down substantially in 1983, cash receipts from sales of corn was up from the 1982 level because of higher prices and sales of corn from the Payment in Kind (PIK) Program. Soybeans accounted for 24% of all cash receipts in 1983, a decrease from 26% a year earlier.

Illinois cash receipts for all commodities in 1983 totaled 8.14 billion dollars, up 3% from 1982. Crop receipts were up 6% in 1983. Higher cash receipts for corn more than offset lower receipts from soybeans, wheat, oats, and several minor crops. Livestock receipts decreased 3% from 1982, totaling 2.29 billion dollars. Decreases in cash receipts for hogs were primarily responsible for livestock decline. Cash receipts for crops accounted for 72% of the total cash receipts in 1983, compared with 70% in 1982 and in 1981.

ILLINOIS CASH FARM INCOME BY COMMODITIES 1983

REALIZED NET FARM INCOME DOUBLES IN 1983

Realized net farm income in 1983 (the amount left after deducting farm production expenses from realized gross farm income of farmers) was 2,474.0 million dollars, double 1982's realized net farm income and almost triple 1981's. Increases in cash receipts and government payments caused realized gross income to increase by 6% while farm production expenses declining 9% caused the increase in realized net farm income.

Total net farm income declined from 934.8 to -584.5 million dollars in 1983. The total net income per farm was \$-5.845, compared to \$8,989 in 1982 and \$17,670 in 1981.

1/ Revised. 2/ Preliminary.

EXPORTS

In fiscal year 1983, Illinois led all States in exports of agriculture products, with a total value of 2,945 million dollars. Illinois exports represented 8.5% of the total U.S. exports of agricultural commodities. The five leading agricultural exporting States for fiscal 1983 were Illinois, Iowa, California, Kansas, and Minnesota.

Agriculture exports from Illinois in 1983 declined 10% from a year earlier and were down 24% from the record high level of FY 1981. The value of exports of each of the major commodity categories was lower in 1983 than in each of the 3 previous years.

In FY 1983, Illinois was the leading State in exports of feed grains and products, as well as the No. 1 exporter of soybeans and its products. In 1983, feed grain exports totaled 1,416 million dollars, and soybean exports amounted to 1,254 million dollars, together accounting for nearly 91% of the total Illinois Agricultural exports. Of this total U.S. feed grains and soybeans exported, Illinois accounted for 19.3% and 16.1%, respectively in FY 1983.

Illinois, in 1983, ranked 6th in the exports of live animals and meat with a total of 48.4 million dollars. Wheat, along with a few more minor Illinois crops, and other livestock products account for most of the remaining Illinois Agricultural products exported in FY 83.

United States Exports Decline 11% in FY 1983

U.S. agricultural export values fell in fiscal year 1983 to \$34.8 billion. Volume also fell 3 percent to 145 million tons. Over the past 2 years worldwide import demand for and export supply of agricultural products particularly U.S. products, have undergone substantial adjustments. High global producer prices encouraged greater production, which in turn, combined with a debilitating recession, lowered import demand. Since 1981, when U.S. export values peaked at \$43.3 billion, export quantity has fallen 9 percent, mainly reflecting adjustments by importers; prices have fallen about 8 percent, primarily reflecting adjustments by exporters.

ILLINOIS AND UNITED STATES TOTAL EXPORTS, BY SELECTED COMMODITIES

SOURCE: USDA, ERS (FATUS)

EXPORT DETERMINATION: USDA's Economic Research Service (ERS) publishes estimates of U.S. agricultural export contributions by State on a fiscal-year basis. These estimates are prepared by a major commodity group, based on the assumption that, for each commodity, a State contributes the same share as its share of production or marketings. For example, if Florida provides 90 percent of all oranges used for processing in the United States, it contributes approximately 90 percent of all orange juice exports. However, where obvious distortions exist, this procedure is amended accordingly.

Source: Population of Illinois counties as published by Illinois Department of Public Health.

Illinois lies midway between the Continental Divide and the Atlantic Ocean and some 500 miles north of the Gulf of Mexico. The climate is typically continental with cold winters, warm summers, and frequent short period fluctuations of temperature, humidity, precipitation, cloudiness and wind direction, primarily in winter. The excellent soil and well distributed annual precipitation of 32 to 48 inches favor a very high standard of agricultural production.

Illinois' climate primarily is the result of being dominated by the air from the Pacific Ocean from fall through winter to spring with incursions of cold, dry arctic air from Canada in winter, and warm, humid air from the Gulf of Mexico in summer.

Since the Gulf is our source of warm air and moisture for precipitation, Northern Illinois, being further from the source is cooler in the mean, has shorter warm episodes, and experiences less precipitation than the South. Northern Illinois is much more susceptible to colder temperatures and longer duration outbreaks from Canada.

Precipitation during fall and winter tends to be distributed uniformly over large areas caused by large storms moving across the continent. In contrast, spring and summer precipitation occurs principally as brief showers or thunderstorms, affecting relatively small areas. This erratic occurrence of warm season precipitation generally results in an uneven spatial distribution.

Sunshine averages more than 70% of the possible total during the three summer months.

Illinois extends nearly 400 miles from north to south, and the January temperature difference between Rockford (north) and Cairo (south) is approximately 12°F in the mean. Temperatures reach zero or below on an average of seven days annually in the extreme North and only one or less in the far South. The lowest temperature of record is -35°F at Mt. Carroll on January 22, 1930.

The north-south mean temperature range in July is only about 6°F since sun angle is more equitable over the State and high relative humidities tend to moderate temperatures. Temperatures reach 90°F or higher on an average of near 20 days annually in the north and about 50 days in the south and west-central. The highest temperature of record was 117°F at East St. Louis on July 14, 1954.

The annual average snowfall ranges from near 30 inches in the extreme North to only 10 inches in the extreme South. The most likely form of winter precipitation in the North is snow, whereas more than 90% of Cairo's winter precipitation falls as rain. Snowfall of 1 inch or more occurs on an average of 10 to 12 days per year in the extreme North and only 3 or 4 in the far South. Snow cover of an inch or more averages about 50 days annually in the North and only about 15 days in the South, exhibiting large year-to-year variation. Central Illinois receives more freezing precipitation than either the North or South.

Thunderstorms average about 35 to 50 annually in Illinois, but most cause little or no damage. On occasion they are accompanied by hail, damaging winds, and tornadoes. Hail falls on an average of two or three days annually in any one locality, but only about once every two years during periods when crops are most susceptible to damage. Most hailstorms are too short in tenure or the stones too small in size to cause major crop damage. About 25 tornadoes occur each year somewhere in Illinois, mostly in spring.

The mean frost-free period ranges from less than 150 days in the extreme North to more than 210 days in the extreme South. The mean date of the last spring freeze ranges from April 1 in the extreme South, to May 5 in the extreme North. The mean date of the first fall freeze ranges from about October 1 in the extreme Northwest to October 30 in the extreme South. Earliest and latest ever frost dates are about 30 days before and after the mean date. Dates given on the next page are the average for the district. Locations within the district having similar exposure usually agree within plus or minus five days. Crop damaging freezes are most often associated with radiation freezes. Under such conditions (clear skies and light winds), the temperature may vary 10°F or more at adjacent ridge and valley locations. The tables on the next page are based on temperatures in a standard Weather Service thermometer shelter at an approximate height of five feet above ground. Under strong radiational conditions the temperature will be lower at ground level.

"Prepared by the Illinois State Water Survey, Champaign"

WEATHER IN 1983

The year of 1983 was one of strong climate contrasts across the State, both from station to station and season to season. Although the average annual temperatures were near normal across the State, and precipitation was generally greater than normal, few will forget the seasonal changes: the mild first few months, the dry summer, or the cold, snowy December.

PRECIPITATION

Precipitation varied from about 35" to about 60", with several stations realizing 10" more than normal. The greatest positive deviations are coincident with the greatest annual totals, Chicago reporting 15.65" greater than normal (wettest ever), Anna with +14.51", Champaign with +13.72" (second wettest ever), and Mt. Carroll with 10.23" greater than normal. The greatest negative deviation from normal was reported at Aledo with -6.27" and only minor negative deviations elsewhere. Although Anna received much greater than normal precipitation, Cairo was almost 6" below normal, and received less than 0.75" from June through August! The total precipitation from July through September at Cairo was the third driest in recorded history. Although Cairo received only 5% of normal August precipitation, Lawrenceville (Lawrence County) received 178% of normal. In spite of Champaign's wet year, soil moisture in July and August in the uppermost three feet was the lowest ever recorded in three years of observations. Similar conditions persisted over much of Central and Southern Illinois leading to much reduced corn and bean yields compared to those of 1982.

Whereas the first few months of 1983, and July and August experienced generally less than normal precipitation at most locations, rainfall in spring, June, and fall, and snowfall in December were significantly above normal.

Interestingly, Central Illinois received about as much snow in March and April 1983 as during the three months of the 1982-83 mild winter. During the first four days of April, more than 3 inches of rain fell in much of Northern and Central Illinois, and locally in Southern Illinois causing the Big Muddy River to rise to near record levels. On the 1st and 2nd of May the entire State experienced thunderstorms with heavy rain, strong winds and some hail. One to four inches of rain was common, and 1-inch diameter hail fell at Melrose (Clark County). Tornadoes were reported at 11 locations in Southern Illinois on May 1 and 2. On May 29, two tornadoes, winds to 45 mph, and 1-inch diameter hail fell on Cook and Du Page counties. There were relatively few severe weather events during June, with only one tornado reported in the State on the 29th in McLean County. Wind, hail and lightning were observed on June 3 in Southern Illinois, again on the 14th in Central Illinois, and from June 27 to 29 over much of the State. No tornadoes were reported during July! Two to four inches of rain fell in Cook, Will, and Du Page counties on the 1st and 2nd, and gusts in excess of 50 mph were common in Northwestern Illinois. Strong winds were reported again in Northeastern Illinois on July 17, 19, 20, and 23, and Carbondale experienced gusts to 60 mph on July 24.

Again, no tornadoes were reported in August within the State, making 1983 relatively free of severe weather. High winds associated with thunderstorms were experienced on August 3 in the North, in Southern Illinois on the 5th, and again in the North on the 10th. Thunderstorms with gusts to about 50 mph were observed in the Southwest on the 22nd, the entire State on the 26th and 27th.

TEMPERATURES

The greatest deviation from normal was only +1.6°F at Peoria, a value well within the normal range.

Mean monthly temperatures were below normal only during April, May, and December. Rockford, Chicago, Peoria, and Springfield reported the coldest December ever, and Moline, the second coldest ever! October was near normal and the remaining months were above normal. Greatest positive deviations from normal were experienced in February, July (+3.5°F common) and August (+6°F common).

Growing degree days across Illinois were very close to the long-term normals, therefore, contours are essentially the same as those on the mean annual temperature chart presented herein. Growing degree day sums varied from about 2500 (base 55°F) in the North to about 4500 in extreme Southern Illinois.

CROPS

Illinois farmers in 1983 saw a large decline in total production of all crops because of the drought and the Payment-In-Kind program. Corn production declined 58% to 624 million bushels as yields were reduced to 79 bushels per acre, the lowest since 1970, and harvested acreage was 7.9 million acres, the smallest since 1945. Soybean production was 267 million bushels, 25% below 1982 as yields were reduced to 29.5 bushels per acre, the lowest since 1974.

Farmers in Illinois marketed 5,849 million dollars worth of crops in 1983. Corn marketings made up 3,512 million dollars, or 43%, and soybeans accounted for 1,941 million dollars or 24% of the total cash receipts from farm marketings. In 1983, receipts from crops represented 72% of the total cash receipts received by Illinois farmers from all farm marketings. Illinois ranked second in the Nation in cash receipts from crops in 1983.

The Agriculture industry in Illinois supplies crop and crop products to much of the world. In 1983, Illinois was the leading State in the Nation in exports of corn, soybeans, and their products. Exports of feed grains and their products (primarily corn) totaled 1,416 million dollars in 1983 while soybeans and soybean products amounted to 1,254 million dollars. These two crops accounted for 91% of the total value of all agriculture exports (crop and livestock) from Illinois in 1983.

FIELD CROPS

In 1983, Illinois saw a large decline in field crop production because of the drought and the Government Acreage Reduction Programs. The corn crop totaled 624 million bushels, the smallest since 1958 while soybean production was 267 million bushels, the smallest since 1976. Wheat and oats production were almost the same as 1982's production as the drought did not begin until these crops were mature.

Farmers in Illinois harvested 20,057,000 acres of crops in 1983. In most recent years, when cropland has been fully utilized and there is no government crop acreage reduction programs in effect, Illinois farmers have usually harvested about 24 million acres.

The table below shows the "All Crop Production Index" with the base period, 1977=100.

CROP PRODUCTION INDEX, 1960 - 83

CROP DEVELOPMENT 1983

The year of 1983 was one of temperature and precipitation extremes. Although the average annual temperatures were near normal across the State, and precipitation was generally greater than normal for the year, extreme weather during critical stages of crop development led to much reduced corn and soybean yields compared to those of 1982.

The first few months of 1983 were characterized by above normal temperatures and below normal precipitation. During April and May, however, temperatures turned cooler than normal and heavy precipitation delayed spring planting progress. A weather turnaround occurred during the month of June, characterized by above normal temperatures and below normal precipitation for much of Illinois--a trend which would continue for most of the growing season. August was particularly damaging to already parched crops, with temperatures soaring 6 to 8 degrees above normal across Illinois, accompanied by below normal precipitation over most of the State. The fall harvest and winter wheat seeding progressed rapidly as the hot, dry weather continued into September. Harvest completion was delayed slightly by heavy rains during mid-October, but the corn and soybean harvests were still finished ahead of the 5-year averages. The months of November and December were characterized by above normal precipitation, including heavy rains in November and several snowstorms during December. Temperatures averaged slightly above normal during the month of November, but in December temperatures plummeted 9 to 14 degrees below normal throughout the State, setting new records and damaging some winter wheat fields and fruit orchards.

Planting of the 1983 winter wheat crop began in mid-September 1982, about the usual starting time, and made good progress through the fall. Virtually all of the 1,550,000 acres planted was seeded by mid-November. Mild temperatures and mostly adequate supplies of soil moisture aided emergence of the crop. However, in December 1982, and April and May 1983, heavy rains caused flooding of low-lying fields, causing some crop damage. The cool, wet spring slowed maturation of the crop and increased the incidence of foliar diseases. Harvest of the winter wheat crop lagged well behind normal when it got underway in late June, but then hot, dry weather allowed rapid progress, with most of the crop harvested by mid-July. Acres harvested of the crop totaled 1,400,000 acres, or about 90% of the planted acreage. The acres not harvested was higher than most recent years, due to the acres lost from water damage, and the acres put into government conservation use. Yield, at 46 bushels per acre, was one bushel above 1982's level, but below the record high yield of 50 bushels per acre set in 1981.

Planting of the corn crop was slowed by the wet, cool spring. Planting progress lagged behind normal from the time planting began in late April until completion in mid-June. Planted acreage totaled 8,200,000 acres, down sharply due to the high participation in the Government Acreage Reserve and Payment in Kind (PIK) programs. Rains very early in the growing season aided emergence of the crop, but then the weather turned hot and dry during the critical pollination stage. Continued adverse weather caused widespread damage and accelerated the maturation of the crop. Harvest began about on schedule in mid-September, and progressed rapidly, finishing over a week ahead of the 5-year average. Farmers harvested 7,900,000 acres of corn for grain, with an average yield for the State of 79 bushels per acre. Generally, the northern counties fared the best, with deteriorating conditions moving down the State. Production for Illinois totaled 624,100,000 bushels--the lowest corn production since 1958.

Soybean planting started in mid-May, after being delayed by wet field conditions. Planting was nearly complete by late June. Illinois farmers planted 9,100,000 acres of the crop, making 1983 the first year that soybean acreage exceeded that of corn. The hot, dry summer weather affected soybean bloom and pod development, and, as with corn, hastened its maturation. Double-cropped soybeans, concentrated in the heart of the drought-ridden South, were most affected. Spider mite infestation was also a problem in many areas, particularly in the southern counties. Harvest of the crop began on time in mid-September, aided by the dry conditions and finished on schedule in early November. Acres harvested totaled 9,050,000, down just 150,000 acres from 1982. Yield, however, was 29.5 bushels per acre, resulting in production of 266,975,000 bushels--the lowest production since 1976.

Oat seeding began on schedule in late March, but quickly fell behind due to the wet April weather. Planting was not completed until late May, several weeks behind the average. Farmers planted 2,100,000 acres of oats, the largest acreage planted since 1962's 2,117,000 acres. The large increase in oat acreage was the result of oats planted as a cover crop on conservation use acres by those farmers participating in the Government Acreage Reduction and PIK programs. Development of the crop ran slightly behind normal for most of the growing season and the hot, dry weather during July caused lighter-weight kernels than normal. Oat harvest began in mid-July and progressed rapidly, nearing completion in mid-August, slightly ahead of normal. Due to the government programs, farmers harvested only 210,000 acres of the crop for grain, with a Statewide average yield of 60 bushels per acre. The resulting production of 12,600,000 bushels was 7% above 1982's record low production, but otherwise, was the lowest oat production in the State since records began in 1866.

Planting of the 1984 winter wheat crop began about on schedule in September 1983. Seeding proceeded at a good rate throughout the fall, keeping pace with the 5-year average. Emergence of the crop was initially slowed by dry soil conditions, particularly in the southern areas, but timely rains during October improved conditions. The crop made good growth progress into December, and in many areas was protected from the extreme December temperatures with snow cover.

Plowing of the 1984 intended corn and soybean acreage began in early October. Plowing progressed rapidly, staying ahead of normal all fall. Heavy rains in November and December, however, did slow fieldwork, particularly in Southern Illinois. By mid-December approximately 64% of the acreage had been tilled, slightly behind normal.

ILLINOIS' POSITION IN NATION'S CROP PRODUCTION

Crops	Date	U.S. total	Illinois total	Percent of U.S. total	Illinois' rank among States

CROP DEVELOPMENT AND VARIETY INFORMATION

Crop development information is collected and published each week during the crop preparation and growing season in the Weekly Weather-Crop Bulletin. In this section, planting and harvesting information for major crops is summarized along with selected information on crop maturity.

Also included in this section are data on leading varieties of soybeans and wheat.

WINTER WHEAT VARIETIES

Caldwell, a soft winter wheat, is the leading variety of wheat grown in Illinois in 1984, accounting for 26% of the total planted acres in the State. In just two years Caldwell went from less than 1% of the total wheat acreage to become the most widely grown variety in Illinois. In 1983, only 4% of the total wheat acres was planted to the variety Caldwell. Hart, after being the leading variety grown in Illinois for the previous three years, dropped to second place in 1984, with 16% of the State acreage. The acres planted to Hart in 1983, 1982, and 1981, when it was the leading variety grown, was 34%, 38%, and 29%, respectively. The third most popular wheat grown in 1984 in Illinois is the private variety, Pioneer 2550, representing 14% of the total wheat acres--up from only 2% in 1983. Roland, with 8% of the wheat acreage, is the fourth leading variety, down from its peak level of 10% in 1983. Another private variety, Pioneer S-76, is the fifth most popular wheat variety with 6% of the State acreage, down slightly from last year's 8%.

Centurk continued as the leading hard wheat variety in Illinois, but accounts for only 1% of the total wheat acreage. Of the limited acreage of hard wheat varieties grown in the State, most are grown in Northern Illinois. Soft wheat varieties account for 98% of the total 1984 acreage, unchanged from 1983. Seeding of private varieties increased slightly from 1983, representing about one-fourth of the total acreage in 1984. The percent planted to private varieties is not available prior to 1983.

FRUIT

1983 APPLE PRODUCTION

Illinois commercial apple production totaled 90.0 million pounds (2,143,000 bushels, 42-pound equivalents) in 1983. Production was up 2% from 1982's crop of 88 million pounds but 13% less than 1981's crop of 103 million pounds. Total value of the 1983 crop is estimated at \$11,936,000, up 2% from last year's \$11,682,000. The 1983 average price per pound is 13.3 cents compared to 13.3 cents in 1982 and 12.9 cents in 1981.

The production potential for the 1983 apple crop was reduced in mid-April by a hard freeze. This was followed by cooler than normal temperatures and wet conditions which caused increased disease problems. Production was hurt further by the hot, dry weather in July and August which stressed many orchards. Warm and dry weather during the fall aided harvest of the crop.

APPLES: Production, price and value, Illinois, 1975-83

APPLES: Production, price and value, Illinois, 1975-83				
Year	Production		Price	Value of
	Total	Utilized	per pound	utilized production
	<u>- Million pounds -</u>		<u>Cents</u>	<u>1,000 dollars</u>
1975	115.0	112.0	7.6	8,512

1983	90.0	90.0	13.3	11,936

1983 PEACH PRODUCTION

Peach production in Illinois totaled 13.0 million pounds (271,000 bushels, 48-pound equivalents), compared to no production in 1982 because of damage from the extremely low winter temperatures. This year's crop was 41% less than 1981's crop of 22.0 million pounds. Total value of this year's crop was \$3,493,000, down 26% from the value of the 1981 crop. The average price per pound in 1983 was 26.9 cents, up 26% from 1981's price of 21.4 cents. Prospects for the 1983 peach crop was reduced when temperatures dropped below freezing for several nights in late April. The cool, wet weather that followed the frost slowed the development of the crop early in the summer. As the crop matured, the weather turned hot and dry in July, further reducing the prospects for the crop. This weather continued through harvest.

1983 SWEET CORN FOR FRESH MARKET

Production of sweet corn for the fresh market in Illinois totaled 315,000 hundredweight, up 4% from 1982 and up 5% from 1981. Acreage harvested totaled 3,700 acres, down 3% or 1,000 acres from 1982 while the yield per acre, at 85 cwt., increased 6%. Value of the crop rose to \$3,497,000, up 30% from last year. The average price was \$11.10 per cwt., up 26% from 1982's price of \$8.83 per cwt.

SWEET CORN FOR FRESH MARKET: Acreage, yield, production, and value, Illinois, 1975-83

1983 SWEET CORN FOR PROCESSING

Production of sweet corn for processing in Illinois totaled 144,560 tons in 1983, down 23% from last year. Harvested acreage, at 34,500 acres, declined 10% or 3,900 acres, from 1982 while 1983's yield of 4.19 tons per acre was 14% below last year's yield of 4.88 tons. Total value of the 1983 crop was \$9,584,000, down 25% from 1982 as the average price declined 3% to \$66.30 per ton.

LIVESTOCK, DAIRY AND POULTRY

Illinois' cattle, hog, and sheep producers received \$1.87 billion from marketings in 1983, 4% below the \$1.95 billion received in 1982. Cattle, hog, and sheep cash receipts in 1983 from marketings and sale of farm slaughter were \$744.58 million, \$1.12 billion, and \$6.02 million, respectively. This compares with 1982 receipts of \$661.64 million for cattle, \$1.28 billion for hogs, and \$9.98 million for sheep. Consequently, cash receipts for cattle increased in 1983 by 13%, while hogs and sheep receipts decreased by 12% and 40%, respectively.

Cash receipts for Illinois egg producers were \$49.8 million in 1983, a 10% drop from the \$55.5 million produced in 1982. The 1983 cash receipts from the production of eggs was the lowest in Illinois since 1972.

Illinois ranks 13th in the U.S. in total cash receipts from dairy products in 1983. This was accomplished by receiving \$361.1 million in 1983 or 2% above the \$353.2 million received in 1982.

All livestock and livestock products in Illinois generated total cash receipts of \$2.3 billion in 1983, down 4% from the \$2.4 billion cash receipts in 1982.

LIVESTOCK CASH RECEIPTS - 1983

MILLION DOLLARS:

CATTLE

Although small herds of cattle are scattered throughout Illinois most land is utilized for the production of grain. The largest concentration of cattle is located in the northern portion of the State where rolling pastureland is more suitable for cattle production. Convenient processing plants, vast supplies of feed, and large consumer markets provide the cattleman of this area appropriate conditions to carry on production.

During 1983 there were 47,000 cattle operations in Illinois of which 6,100 or 13% were milk cow operations and 11,000 or 23% were cattle on feed operations.

Milk cows present on dairy operations in Illinois totaled 228,000, computing to an average size operation of 37 head. The leading state in the dairy industry (Wisconsin) had 1,845,000 head of dairy cows on 44,000 operations throughout the State. This produced an average size operation of 41 head.

Cattle on feed marketed in Illinois totaled 955,000 head, with an average size feeder operation of 87 head. By comparison, the leading state in cattle marketings (Texas) had 1,000 cattle on feed operations and boasted an average operation of 4,400 head.

Drought and sharply higher grain prices forced more cattle on the slaughter market in the second-half of 1983. Consequently, cattle numbers for Illinois and the entire U.S. experienced declines in 1983. The number of cattle and calves on U.S. farms on January 1, 1984 totaled 114 million head, 1% below the 115.2 million in 1983. In Illinois all cattle inventory decreased by 7%, from 2.8 million head at the beginning of 1983 to 2.6 million January 1, 1984. The cattle inventoried in Illinois on the first day of the year were valued at \$1.04 billion, a 7% decrease from the previous year.

The counties leading in the number of all cattle on farms on January 1, 1984 were Stephenson, 97,100; Jo Daviess, 96,000; Ogle, 82,800; Carroll, 78,100; Henry, 72,600.

The number of beef cows on Illinois farms January 1, 1984 totaled 682,000, a drop of 6% from the year earlier level of 722,000. The top five counties in beef cow numbers were Fulton, 23,000; Adams, 21,500; Pike, 21,500; Jo Daviess, 20,900; Knox, 20,800.

The number of milk cows on January 1, 1984 was 1% below the year ago level, 228,000 head compared to 230,000 on January 1, 1983. The five leading counties in milk cow numbers on January 1, 1984, were Stephenson, 34,000; Jo Daviess, 22,300; Clinton, 18,100; McHenry, 15,100; and Washington, 9,900. The 1983 calf crop was down 4% from the 1982 level to 800,000 head from 830,000.

The number of cattle and calves on feed January 1, 1984 for the slaughter market was 510,000 head. This was a 4% decrease from the January 1, 1983 level of 530,000 head. The cattle on feed inventory consisted of 266,000 steers and steer calves and 244,000 heifers and heifer calves, down 11% and up 6% respectively from a year ago.

The number of cattle and calves marketed during 1983 totaled 1,462,000 head. This was an increase of 12% over the 1982 level of 1,309,000 head marketed. The number of cattle and calves on feed marketed during 1983 totaled 955,000 head. This was an increase of 5% from the 1982 level of 910,000 head marketed.

HOGS AND PIGS

Approximately 15% of all cash receipts to farmers in Illinois are derived from the sale of pork. In 1983, cash receipts amounted to \$1.124 billion or 13.8% of all cash receipts, compared to \$1.279 billion and 16.2% in 1982.

Pork production is centered primarily in the northwestern counties of the State—from Henry on the north to Pike county on the south. The leading counties in hogs and pigs are Henry, 297,600; Pike, 208,200; Adams, 164,200; Knox, 153,400 and Mercer, 139,200. The number of farms in Illinois considered to be hog farms has declined steadily in the past 5 years. In 1979, there was an estimated 32,000 hog farms in the State, compared to 25,000 in 1983—a decline of 7,000 farms.

The number of hogs and pigs on farms in Illinois is estimated quarterly. The first quarter is historically the lowest of the year; this holds true for 1983, as the March 1 estimate was 5,300,000 head. The third quarter normally has the highest inventory for the year; this also was true in 1983, as our inventory peaked on the September 1 quarter at 6,100,000 head. The second and fourth quarters are yet to establish a predictable trend.

Illinois hog producers had 5.40 million hogs and pigs on hand December 1, 1983, down 4% from the 5.60 million level a year earlier. The inventory consisted of 725,000 breeding stock and 4,675,000 market hogs and pigs.

The average value per head for hogs and pigs on hand December 1, 1983 was \$58.00, a decrease of \$38.00 from the previous year's value of \$96.00. This decrease in value accounted for virtually all of the decline in total value to \$312,200,000, since actual inventory decreased very little between December 1, 1982 and December 1, 1983.

Farrowings for the period December 1982 through November 1983 totaled 1,320,000, an increase of 1% from a year earlier. The average number of pigs saved per litter over the same period was 7.30, compared to 7.00 the previous period.

The December 1982 through November 1983 pig crop was 9,636,000, up 5% from a year earlier. Hog and pig marketings in 1983 totaled 9,691,000 head, down 1% from the 1982 level of 9,768,000.

1/ ANNUAL ESTIMATES COVER PERIOD DECEMBER 1 PREVIOUS YEAR THROUGH NOVEMBER 30.

SHEEP AND WOOL

The number of sheep and lambs on Illinois farms January 1, 1984 totaled 145,000, down 6% from the previous year level of 155,000. The top five counties in stock sheep numbers on January 1, 1984 were Henry, 4,400; Ogle, 4,400; La Salle, 3,800; Adams, 3,800; and Woodford, 3,700.

An estimated 128,000 lambs were born during 1983, compared with 133,000 during 1982, for a decline of 4%.

The value per head for stock sheep increased \$1.00, to \$57.50 on January 1, 1984. The total value of all sheep and lambs fell 5% from January 1, 1983 to January 1, 1984 to \$8,338,000.

The estimated 181,000 sheep shorn in Illinois during 1983 produced an average weight per fleece of 6.7 pounds for a production total of 1,214,000 pounds of wool. This is in comparison with the 208,000 head shorn in 1982 with an average weight per fleece of 6.7 pounds for a total of 1,385,000 pounds of wool. The average price per pound for wool was up 6 cents during 1983, from 34 cents in 1982 to 40 cents in 1983. The value of wool production increased 3%, from the \$471,000 in 1982 to \$486,000 in 1983.

An estimated 143,000 head of sheep and lambs were marketed in 1983, down 35% from the 220,000 marketed in 1982.

POULTRY AND EGGS

The total number of chickens on hand (excluding broilers) in Illinois December 1, 1983 was 4.91 million, a 19% decrease from the 6.05 million inventory on December 1, 1982. The total value of the chicken inventory decreased 23% from December 1, 1982 to December 1, 1983 to \$8.10 million.

The average number of layers on all Illinois farms during 1983 was 4.12 million, a decline of 14% from the 4.81 million in 1982. The leading counties in average number of layers during 1983 was Iroquois, 789,000; Clinton, 700,900; Will, 181,900; Livingston, 146,700; Sangamon, 137,000.

Egg production during 1983 totaled 1.00 billion eggs, down 14% from the 1982 total of 1.16 billion eggs. The laying rate during 1983 averaged 244 eggs per layer, slightly higher than the previous year.

There were 208,000 turkeys produced in Illinois in 1983. The 1983 turkey production dropped 29% from the 291,000 reported in 1982 and 49% from the 407,000 reported in 1983.

MINK

Mink production in Illinois is located primarily in the northeastern corner of the state near Chicago. The heaviest concentration of mink operations is in McHenry, Lake, and Kane counties. Only a few operations are located out of this main area.

Illinois ranks fifth nationally in mink production and comprised 5% of the Nation's total mink supply during 1983. By producing 202.9 thousand mink pelts Illinois mink producers have increased production in 1983 by 12%. In years past the production of mink has followed a scattered trend. During 1983 the females bred to produce kits in 1984 totaled 51.5 thousand, up 1.4% from the 50.8 thousand females bred to produce kits in 1982.

Several mink color classes are produced in Illinois, with "Standard" the most prevalent. During years where the data lends itself available without disclosing individual operations, the "Demi-buff" color class was second in popularity with "Pastel" third and "Pearl" fourth. The remaining balance of mink furs produced in Illinois fall in the "Sapphire," "Gunmetal," "Violet Type," and "Other" categories.

DAIRY AND DAIRY PRODUCTS

Total milk production in Illinois during 1983 totaled 2.706 billion pounds, an increase of 49 million pounds (1.8%) from 1982. This production is the largest recorded since 1973. Milk produced per cow during 1983 was a record high 11,868 pounds, 415 pounds above the previous record in 1982.

The annual average number of milk cows on Illinois farms decreased by 4,000 head (1.7%) during 1983 to 228,000. Milk cow replacement heifers on January 1, 1984 totaled 105,000 head, 2,000 less than a year earlier. This makes the ratio of replacement heifers to milk cows 46.05 heifers per 100 dairy cows.

Milk production is centered primarily in the extreme northern counties of the State--from Jo Daviess on the northwest to Kane county on the northeast. A few producers are scattered out of the main area--in southwestern Illinois. The counties leading in milk cow numbers in 1983 were: Stephenson, 34,600; Jo Daviess, 22,300; Clinton, 17,900; McHenry, 15,300 and Washington, 9,600.

Milk production in Illinois peaked in the decade of the 1940's, with production at 54.4 billion pounds. Production has decreased steadily in the past 40 years. In the decade of the 1950's production dipped to 48.7 billion pounds; the 1960's dropped even more to 36.3 billion; and the 1970's production slipped to 28.2 billion pounds. While production has continued to decline so has milk cow inventory numbers; in 1954 Illinois milk cow inventory was estimated at 824,000 head. Illinois milk cow inventory declined every year from 1954-1979, with 1979's inventory estimated at 231,000 head. While milk cow inventory and production has steadily declined; milk per cow has steadily increased. Milk per cow for 1950 was estimated at 5,630 pounds. Since 1950 milk per cow has been up 28 out of the last 33 years. The 1983 estimate of milk per cow was the all-time high at 11,868 pounds.

The total number of farm operations with milk cows declined by about 100 (1.6%) in 1983. Milk cow farms accounted for 6.1 percent of all farms in 1983, compared with 6.0 percent in 1982.

Dairy and dairy products accounted for \$361.1 million (4.4%) of the total cash receipts to farmers and ranchers in Illinois for 1983; this compares with \$353.2 million (4.5%) for 1982.

During 1983, ice cream production increased by 4%, ice milk by 1%, all cheese by 7%, and creamed cottage cheese by 25%.

LIVESTOCK SLAUGHTER

Illinois slaughter plants produced 2.16 billion pounds of red meat in 1983, a 15% increase from the 1.88 billion pounds produced in 1983. This ranks Illinois 5th in 1983 among red meat producers in the U.S. and comprises 6% of the Nation's production of red meat.

Beef production in 1983 totaled 1.20 billion pounds or a 24% increase from the 968 million pounds produced in 1982. There were 1.16 million head of cattle slaughtered in Illinois in 1983, an increase of 22% from the 944 thousand slaughtered in 1982. The average liveweight of cattle slaughtered in Illinois increased slightly from 1,025 pounds in 1982 to 1,037 pounds in 1983.

LIVESTOCK SLAUGHTER - CATTLE

In 1983 Illinois contributed 6% to the Nation's veal production of 729 million pounds. This ranked Illinois 7th among all states in the production of veal with a total of 43.5 million pounds, 8% less than the 47.4 million pounds produced in 1983. There were 192 thousand calves slaughtered during 1983 in Illinois. The most recent year to exceed this amount of calves slaughtered was in 1968 when 202 thousand were slaughtered.

Illinois ranks second among all states in the pork industry by contributing 9% to the 21.28 billion pounds produced in the U.S.

During 1983 there were 7.80 million hogs slaughtered in Illinois weighing 1.94 billion pounds. This was 11% above the 1.75 billion pounds produced in 1982. Records show there has not been this many hogs slaughtered weighing this much dating back to 1954. The average liveweight per hog calculates to 249 pounds per hog.

LIVESTOCK SLAUGHTER - HOGS

In Illinois the production of sheep and lambs totaled 17.4 million pounds during 1983 and ranked this state 9th among all states in the U.S. This production was down significantly (47%) from the previous year's total of 37.4 million pounds. Illinois sheep and lamb production represents 2% of the 741 million pounds produced nationwide. With 169,000 head slaughtered in 1983 the average liveweight per animal was 103 pounds, an 8% drop from the 112 pounds per animal slaughtered in 1982.

1983 CROP AND LIVESTOCK INDEXES

The Illinois Prices Received Index has been computed from 1956 to the present using new quantity weights each year. The Illinois Index relies on weights based on the average value and quantity of each commodity sold during a previous 5-year period.

The all farm products index of prices received by farmers in 1983 was 114% of it's base period, 1977 through 1981. This is 5% higher than the 1982 index, but 8% below 1981. The increase in the level of the index from 1982 was primarily due to higher prices for the 1983 drought-stricken crops, which more than offset lower 1983 prices for livestock that occurred for much of the year. The index began 1983 at a year's low of 102, but slowly gained momentum, fueled by higher crop prices, until it reached a high of 124 in August and September. The all farm products price index then dropped-off slightly after September, but still finished the year at 120 in December.

The index of prices received for all crops, at 115% of it's base period, was 14% above 1982, but 8% below 1981. The index began at a year's low of 93, caused by sluggish prices leftover from 1982's bumper crop. Crop prices improved during the dry summer, however, until the index reached a high of 132 in September. The index decreased slightly after September, ending the year at 124.

The index of prices received for all livestock and livestock products was 112% of its base period. This is 11% lower than 1982 and 9% lower than 1981. Prices for most livestock were generally lower during 1983 than 1982, particularly for hogs. The livestock index began the year at 120, then climbed slightly to 124 in February before starting a general decline. The index recovered slightly to 111 in August, but then continued the downward trend, reaching the year's low of 101 in November.

1/ Annual average is for December previous year through November current year.

PRICES PAID

Prices paid by farmers for major production items are collected from dealers and merchants at regularly recurring intervals by means of telephone and personal interviews. This information provides a historical series of prices paid for important production goods and services but perhaps more importantly provides cost data used in calculating the index of prices paid by farmers at the U.S. level. Also included in the index of prices paid are interest, taxes and wage rates. The index of prices received for all farm products sold, when divided by the index of prices paid gives a measure of what farm products will buy in terms of production needs such as fertilizer and machinery, and family living items.

The table below shows average prices paid by Illinois farmers for selected feeds and motor supplies in 1981 thru 1983. Beginning in January 1977, the Bureau of Labor Statistics Consumer Price Index (CPI) was used to measure farmers' costs for family living items. Therefore, data on family living costs are no longer collected by the Department of Agriculture.

State or regional prices paid for feed, seed, fuels, and fertilizer, and U.S. prices for all commodities are published currently in AGRICULTURAL PRICES, a monthly report of the Statistical Reporting Service of the U.S. Department of Agriculture, Washington, D.C., 20250. Regional prices for building materials, farm machinery, farm supplies, pesticides, and motor supplies other than fuels are also published currently in AGRICULTURAL PRICES.

PRICES PAID: Average prices paid by Illinois farmers, December 15, 1981-83 1/

Item and unit	1981	1982	1983
	Dollars

FARM PRODUCTION EXPENDITURES

Farm production expenses incurred in the Corn Belt Region totaled \$28.1 billion in 1983. This comprised 21.4% of the \$131.2 billion expenditures totaled in the U.S. The expenditure items illustrated much similarity when comparing the Corn Belt Region with the entire Nation. Farm services, including rent, showed the most sizeable difference by accounting for 23.7% of expenditures in the Corn Belt Region, and 17.5% of expenditures for the U.S. as a whole. Purchases for seeds, plants, fertilizers, lime, soil conditioners, and agricultural chemicals comprised 15.1% of the Corn Belt Region expenditures and 11.7% of the total U.S. expenditures. Interest and taxes among the Corn Belt States was 14.4% of the total, while U.S. expenditures for this item made up only 12.7% of the total. The proportion of expenses allotted to automobiles, trucks, tractors, and farm machinery was slightly higher for the Corn Belt Region at 7.9% compared to the U.S. at 7.5%.

Expenditures which were allocated to wages was 4.7% higher on a Nationwide scale compared to the Corn Belt Region. This reduced cost relative to other areas can be attributed to the highly mechanized production process involved on large farms. Other components, in which U.S. farmers exceeded corn belt farmers in percentage comparisons, were in purchases of feed by 3.6%, livestock and poultry by 1.7%, fuel, energy, farm and motor supplies by 1.4%, and building and fencing by .3%.

Farm production expenditures are collected from a sample of nearly 10,000 farmers and ranchers Nationwide on an annual basis. Individuals are chosen from a list of farm operators supplemented with producers living inside randomly selected geographical areas to ensure representation of all farms with at least \$1,000 worth of agricultural sales. The respondents are asked to report expenditures for groups of items, i.e., seeds, plants, fertilizer, lime, soil conditioners and chemicals. These expenditures are then summarized on a National basis and by economic class of farm, by farm production region, and by economic class of farm, by region.

Expenditures	CORN BELT REGION		UNITED STATES	
	Dollars (million)	Percent of total	Dollars (billion)	Percent of total

1/ This fertilizer information was obtained when interviewing farm operators for Objective Yield Surveys conducted by the Statistical Reporting Service and are not official estimates of total fertilizer use. The samples are relatively small and the data are subject to sampling fluctuation. 2/ Percentages apply to acres receiving fertilizer, not to total acres harvested.

ORDER FORM

The following publications are available on an annual subscription basis from the Illinois Cooperative Crop Reporting Service. Subscription fees are not refundable.

Free copies of these reports are available to the News Media, Illinois farm operators and other respondents supplying information for compilation of the reports.

Paid subscriptions will be distributed by first class postage.

HOW TO ORDER:

Check the title of each report you wish to order, enter the subscription rate in the space provided and total cost at the bottom of the column.

Publications	Annual Subscription Rate		Enter Amount Enclosed for Each Publication Ordered
	United States	Foreign	
☐ ILLINOIS FARM REPORT Four page bi-weekly report issued about the 12th and 26th of the month containing data on crop acreages, production, grain stocks, livestock, fruit, vegetables, prices, farm labor and fertilizer sales.	\$10.00	\$12.50	\$ _____
☐ ILLINOIS WEATHER & CROP Weekly report on crop conditions and weather data from planting thru harvest; monthly for the rest of the year.	\$12.00	\$15.00	\$ _____
☐ ANNUAL SUMMARY - ILLINOIS AGRICULTURAL STATISTICS - A summary of all information issued during the previous year with historical data for comparison plus county data on harvested acreage and production of crops and livestock numbers. The Annual Summary package includes supplemental mailings of county estimates for corn, soybeans and wheat.	\$ 5.00 (No charge to Illinois residents)	\$ 6.25	\$ _____
☐ ILLINOIS TIMBER PRICES Semi-annual one sheet report on timber prices by species and region.	No Charge

Published quarterly by the Indiana Employment Security Division

THIRD QUARTER 1984 SEASONALLY ADJUSTED

INDIANA NONAGRICULTURAL EMPLOYMENT

Statewide nonagricultural establishment employment rose moderately from second quarter 1984 to third quarter 1984, and increased significantly from third quarter 1983 to third quarter 1984. However, the current total of 2,070,900 was 184,000 below the record high second quarter of 1979.

Manufacturing employment declined slightly between quarters chiefly from the continuing slide in steel mill production. Otherwise, in durable goods, small gains were recorded in many industries, led by autos and parts, and nonelectrical machinery. From a year ago, manufacturing employment posted a meaningful increase with both the durable and nondurable sectors contributing to the upturn. The recovery in durable goods was directed by advances in the machinery and transportation equipment industries, while in nondurable goods, rubber and plastics, which is production oriented toward the auto industry, contributed mainly to the overall increase.

Nonmanufacturing employment grew significantly both over the quarter and over the year. Educational services, retail trade, services, and construction guided the industry division expansions from the second quarter. Over the year, total trade and services were the prime components in the overall addition to payrolls.

Occupational Wage Surveys Scheduled

For Service Delivery Areas (SDAs)

As Well As For Individual Counties

Special Reports Summarize
Statewide Wage Data

The Indiana Employment Security Division conducts Occupational Wage Surveys of manufacturing firms throughout the State of Indiana. Area wage information is in high demand and is widely used by employers and employee groups, government, colleges and universities, vocational and technical schools, chambers of commerce, and other civic organizations. This information can be a valuable resource in economic development efforts.

Wage information is currently available for the following occupational categories: office jobs, technical and data processing jobs, selected skilled jobs, and selected production jobs. Additional production jobs are included under the headings of skilled, semiskilled, and unskilled hourly workers. Current and potential employers can be shown the wage structure for individual areas, multi-area regions, or the state as a whole. Wage breakouts are also available for major industry sectors and by firm size.

Selected For SDA Counties

Individual Occupational Wage Surveys are conducted for each of Indiana's ninety-two counties over a two-year cycle. In response to the needs of the federal Job Training Partnership Act, changes in scheduling have been made so that counties comprising entire Service Delivery Areas will be surveyed at one time. A Service Delivery Area (SDA) is an area composing from one to eleven geographically contiguous counties designed to promote effective delivery of job training services. This focus on SDAs does not mean that the traditional county format for conducting Occupational Wage Surveys has been abandoned. SDA level publications will be provided in addition to regularly scheduled area survey publications.

SDAs and their respective counties scheduled to be surveyed in 1985 include: Northeast Indiana (Adams, Allen, DeKalb, Huntington, Noble, Steuben, Wells, Whitley); the Circle Seven Training Council (Boone, Hamilton, Hancock, Hendricks, Johnson, Morgan, Shelby); the Lake County Job Training Partnership (Lake); Kankakee Valley (Jasper, LaPorte, Newton, Porter, Pulaski, Starke); Madison-Grant (Grant, Madison); North Central Indiana (Cass, Fulton, Howard, Miami, Tipton, Wabash); Marion (Marion); Michiana (St. Joseph); and Hoosier

Falls (Clark, Crawford, Floyd, Harrison, Orange, Scott, Washington). Publication of individual Occupational Wage Surveys at any level of detail hinges upon the availability of sufficient data.

Wage Survey Special Reports Available

The following, three examples of Wage Fact Sheet publications summarize the results of the 1982-1983 statewide Occupational Wage Survey. Each report details the wage medians and number of workers employed for each occupation.

The first Wage Fact Sheet summarizes data for workers employed by durable goods manufacturers and data for workers employed by nondurable goods manufacturers.

A second Wage Fact Sheet reports data for manufacturers employing over 300 workers and data for manufacturers employing 300 and fewer workers.

The third report presents a general statewide summary, including the middle range of wages for all surveyed occupations.

Indiana Labor Market

INDIANA STATEWIDE
(Durable &
Nondurable Goods)
Wage Fact Sheet

AN OCCUPATIONAL WAGE SURVEY SPECIAL REPORT

Durable goods largely dominate the manufacturing industries in Indiana. Approximately 74 per cent of all manufacturing employment included in the Occupational Wage Survey is in durable goods firms. It is generally believed that wages are higher in durable goods than in nondurable goods manufacturing. This would seem to be true, generally, as can be seen in the comparison that follows. In some occupations, however, nondurable goods firms have higher medians, and wages paid in both sectors are generally competitive.

Comparisons should be made very carefully. Though many occupations are common to both durable and nondurable goods, the nature of the occupation may be different. For example, welders make higher median wages in nondurable goods than in durable goods. It should be noted that the welders in nondurables are almost all maintenance welders, because, by nature of the product, production welders are rarely needed in nondurables. A significant number of production welders are, by the nature of the product, needed in durable goods. Production welders are generally paid less than the more versatile and highly trained maintenance welders. This may account for at least part of the difference in wage medians.

NEW AFFIRMATIVE ACTION HANDBOOKS

REFLECT 1980 CENSUS DATA

Affirmative Action information handbooks are now available for the State of Indiana and the Indianapolis, Gary-Hammond-East Chicago and Anderson SMSA areas. Handbooks for the remaining SMSA areas should be available by the end of the year. Handbooks for the larger metropolitan areas and balance of state counties will become available as printing is completed in early 1985.

The information included in the Affirmative Action handbook has been selected to assist employers who are developing or updating their affirmative action plans. The tables included provide data for a significant portion of the items that the Office of Federal Contract Compliance requires to be considered in estimating the availability of minorities and women.

Presents 1980 Census Data

The tables found in these handbooks, with the exception of the annual average labor force data, present information from Report 3: Social Indicators for Planning and Evaluation, 1980 Census of the Population. The sequence of topics referred to in the tables remains much the same as in previous labor market information publications containing Affirmation Action information. However, the reference numbers to the Report 3 tables were retained.

These tables are included in the handbook:

- Employment Status by Sex and Minority Status
- Population by Sex and Detailed Race/Ethnic Group
- Labor Force Status by Sex
- Veteran Status
- Disability Status
- Major Occupation Groups of Employed Persons
- Major Occupation Groups of Employed Females
- Detailed Occupation Groups of Employed Persons
- Detailed Occupation Groups of Employed Females

Labor Force Data Updated Annually

The "Employment Status by Sex and Minority Status" table currently available includes 1983 annual averages for the estimated labor force, employment, and unemployment totals

and unemployment rates. The distribution of the total labor force is based on the 1980 Census proportions.

A specific count of persons of Spanish origin is shown separately from the other minority population groups. Vertical per cent distributions which show the ratio of each racial category to the total for the labor force, employed, and unemployed, are also included. The information contained in this table is updated annually, and will be available by mid-year following the end of the most recent calendar year. Other tables included in the handbook will not be changed until the data from the 1990 Census becomes available.

Additional information found in the handbook includes:

- Description of tables
- Local offices serving employers in their area
- Other Affirmative Action data sources
- Key to symbols, footnotes and definitions used in handbook

Census Data Good until After 1990

Since 1980 census data will be valid until after the 1990 Census, only the "Employment Status by Sex and Minority Status" table will be updated annually. Once handbooks have been received, they should be retained as a permanent part of your Affirmative Action reference material until new census data becomes available. Persons requesting updated material will then need only to ask for annual average labor force data each year to keep the handbook up to date.

Initial requests for Affirmative Action information handbooks, or updated "Employment Status by Sex and Minority Status" tables which currently show 1983 annual average labor force data, should be addressed to a local Indiana Employment Service office in your area or the Indiana Employment Security Division administrative office.

More than Two-Thirds of Indiana Counties

Qualify as Labor Surplus Areas

Employers Become Eligible for

Federal Procurement Preference

Eight major cities and 67 counties in Indiana are eligible labor surplus areas, according to a new list announced by the U.S. Department of Labor. (See list on next page.) Effective October 1, 1984, the list will remain in effect through September 30, 1985.

Employers located in these labor surplus areas are eligible for preference in bidding on Federal procurement contracts. The purpose of the program is to direct more of the government's procurement dollars into high unemployment areas where people have the most severe economic need.

Normally, an area is classified as a labor surplus area when its average unemployment rate was at least 20 per cent above the average unemployment rate for all States during the previous two calendar years.

The reference period used in preparing the current list of labor surplus areas was January 1982 through December 1983. During this period, the national average unemployment rate was 9.6 per cent.

During periods of high national unemployment, an area is classified as a labor surplus area if its unemployment rate during the previous two calendar years was 10 per cent or more. This 10 per cent "ceiling" provision comes into operation whenever the 2-year average unemployment rate for all States was 8.3 per cent, or above (i.e., 8.3 per cent times the 1.20 ratio equals 10.0 per cent).

As a result, areas were included on this current annual labor surplus area listing if their average unemployment rate during the reference period was 10.0 per cent, or above. Nationally, the number of labor surplus areas total 1,442.

Classification of labor surplus areas has been a function of the Department of Labor since the inception of the labor surplus area program in the early 1950's.

Labor Surplus Areas
Eligible for Federal Procurement Preference
From October 1, 1984 through September 30, 1985

Covered Employment includes employees working for firms subject to the Indiana Employment Security Act. The Act, in general, includes employers with one or more employees. Excluded are railroads, small non-profit institutions and churches. Beginning with January 1, 1978, all state and local government employment, including that in schools, is covered. Accredited private and parochial school employment is also covered. However, only part of the employment in private households and on farms is included in the expanded coverage.

Average weekly earnings are computed from the quarterly earnings and average employment of all employees in establishments covered by the Act. The figures are computed from total payrolls so they include all employees--janitors, company officers, factory workers, office employees--instead of only production workers. The new coverage in 1978 affects the all covered employment average so these averages are discontinuous from those calculated for prior years.

Indiana Labor Market

4TH QUARTER 1984

Issued quarterly by
INDIANA EMPLOYMENT SECURITY DIVISION

A large outline of the state of Indiana serves as a background. Overlaid on this map is a line graph. The graph is composed of several parallel lines that form a series of peaks and valleys, representing economic trends. A rectangular box is superimposed on the upper left portion of the map, containing the word 'TRENDS' in large, bold, capital letters.

FOURTH QUARTER 1984 SEASONALLY ADJUSTED

INDIANA NONAGRICULTURAL EMPLOYMENT

Statewide nonagricultural establishment employment rose slightly from third quarter 1984 to fourth quarter 1984, and increased moderately from fourth quarter 1983 to fourth quarter 1984. However, the current level of 2,078,700 was still 176,200 below the record high second quarter of 1979.

Manufacturing employment remained virtually unchanged between quarters as a small drop in durable goods was almost totally offset by a comparable rise in nondurable goods. In durable goods over the quarter, an increase in transportation equipment could not overcome decreases in electrical machinery and primary metals. From the third quarter, most nondurable goods industries inched upward. Both durable and nondurable manufacturing employment rebounded almost equally over the previous year. The overall gain would have been greater if not for the persistent loss in steel mill production.

Nonmanufacturing employment grew slightly over the quarter but more prominently over the year. Trade, services, and the government divisions recorded the larger increases from both previous time spans.

UI REGULAR BENEFITS PAID IN 1983 DOWN ABOUT 27 PER CENT FROM 1982

Four Years of Heavy Payments

Draw Down Trust Fund

Claims filed and benefits paid under unemployment insurance in Indiana decreased substantially in 1983 as the recession began to subside.

While 1983 benefit payments were about one-fourth lower than in the previous year, 1983 was the fourth year in which benefit payments were much higher than was typical of previous years. As a result of the heavy draw down, it was necessary to borrow funds briefly from the U.S. Treasury.

While the immediate problems have receded somewhat, the difficulties arising during the last four years have prompted study of what is needed for the changing Indiana economy.

Weeks of Benefits Paid Down One-Fourth

The 346,726 new claims filed in local offices for regular state benefits were down 19.3 per cent from the previous year and were 10.5 per cent lower than in 1981.

The weeks of benefits claimed (3,721,405) were 24.6 per cent lower than in 1982 and 10.2 per cent higher than 1981.

Including claims from persons who had worked for Indiana employers but are now living outside the State, some 350,384 new claims were received. Of these, 67.8 per cent (237,560) were determined to be eligible for benefits.

Just under 84 per cent of these eligible claimants, or 198,917, received at least one payment of benefits and about 46.2 per cent of them exhausted all of the regular benefits which they were entitled to receive.

The total of all weeks of unemployment compensated was 3,172,797 in 1983, which was 25.6 per cent less than in 1982 and 13.8 per cent more than in 1981.

The average weeks claimed per initial claim was 6.5, up from 6.2 weeks in 1982 and 5 weeks in 1981. This is an approximate measure of the average duration per spell of unemployment.

The potential duration for all eligible claimants averaged 20.8 weeks, but among those who actually received benefits, the actual duration averaged 16.0 weeks. Among those beneficiaries who exhausted their benefits the average duration was 20.6 weeks, which was quite close to the potential duration.

Decrease in Benefits Paid

All regular benefits of \$290,441,838 were paid in 1983, a decrease of 27.0 per cent below 1982 but 15.8 per cent higher than 1981.

Currently, a claimant with no dependents may receive up to \$84 a week of insured unemployment; with four dependents (the highest number considered) a claimant may receive up to \$141 a week. The average weekly benefit for total unemployment for all claimants was \$93.06, a decrease of \$1.18 from the 1982 amount.

In September 1983, Indiana's average weekly benefit amount ranked 48th among the 50 States and the District of Columbia. Only three States had averages lower than Indiana. The "all States" average was \$121.32.

The \$93.06 average weekly benefit amount was 28.6 per cent of the \$325.67 estimated average weekly wage received by workers in employment covered by the Indiana Employment Security Act.

Extended Benefits Ran from January to April

The Extended Benefits program triggered on in January 1983 and triggered off in April 1983 for Indiana claimants. The EB provisions enable claimants who have exhausted their regular benefits, in less than a year's time since the first filing of their claim, to apply for an extension of up to 13 weeks of benefits at the same weekly rate as their original claim. The Federal government pays 50 per cent of the benefit costs of most of the EB program for those claimants formerly employed in private industry, and 100 per cent for ex-employees of the Federal government, or the military services.

For all types of claimants, 84,824 applications for Extended Benefits were filed and 533,450 weeks of benefits were claimed in 1983. The 1983 level of initial claims was about one-fourth (27.0 per cent) less than the peak year of 1980, and the 1983 number of weeks compensated was about one-third (33.3 per cent) less than 1980. About 89 per cent, or 75,422 claimants, of those who applied for EB benefits were compensated, for a total of \$48,930,457.

Further Benefits from FSC Program

For long-term unemployed, another program, Federal Supplemental Compensation was passed by Congress in 1982 to continue benefits for another 8 to 14 weeks, or more, for some

claimants who had exhausted their other eligibility. During 1983, the first full year the program was in operation, some 112,085 initial claims were filed, of which 94,109 claimants received some benefits. A total of 1,157,163 weeks of unemployment was compensated under the FSC program, with benefits totalling \$101,986,093.

TRA Payments Continue to Decline

Some 1,169 first payments were paid under the Trade Readjustment Allowance (TRA) program to those who became unemployed due to foreign competition.

While the number who received at least a first payment was higher than in 1982 (740), the 1983 payments totalling \$1,830,450 for 16,369 weeks of unemployment in Indiana were lower than in 1982, partly because of Federal Supplemental Compensation.

Overpayments Recovered

During 1983, the Division determined that \$4,435,049 in overpayments were made. This amount was about \$1.40 for each \$100 of benefits paid. Overpayments involving willful misrepresentation by claimants amounted to \$559,062, or about 12.6 per cent of the total overpayments. The Division recovered \$2,896,884 in overpayments last year.

About 95 Per Cent of Workers Covered

An estimated average of 1,915,900 workers was covered under the Indiana Employment Security Act in 1983. These workers comprise about 95 per cent of all nonfarm employment in the State.

Employers Paid About 3 Per Cent of Payrolls

Indiana employers contributed some \$339,479,000 in payroll taxes to the Employment Security Trust Fund (from which benefits are paid), which was 3.06 per cent of their taxable payrolls in 1983, and 1.24 per cent of their total payroll.

The average employer contribution rate on taxable payroll in 1983 placed Indiana in 16th rank among all States. The "all States" average was 2.78 per cent.

In addition to tax-paying employers, some State and local units of government, non-profit organizations and other non-profit institutions reimbursed the Trust Fund for benefits paid to their former employees.

Heavy Payments Draw Down Trust Fund

The 3.06 per cent tax rate paid by employers was considerably higher than the 2.77 per cent rate paid in 1982. Heavy benefit payment loads and a rate schedule revision have forced employer contribution rates to be stepped up to higher levels. Also, the taxable payroll was higher, in part, because workers' tax base was changed from \$6,000 to \$7,000 for 1983.

Higher rates during the last three years were made necessary by the continuing high volume of unemployment benefit payments in 1980, 1981, 1982 and in 1983. Annual payments during the last four years have been much greater than were typical in previous years.

More than \$308,159,000 in unemployment benefits which reduced the Trust Fund were paid in 1983, the third highest payment year in the Fund's history. This is \$106 million less than the more than \$414 million paid in the 1982 peak year, and nearly \$50 million less than that paid in 1980.

The last four years of recession-induced unemployment benefit payments have drastically reduced the Trust Fund balance. For example, the balance fell from \$432 million in August 1979 to a negative balance in April 1983.

As a result of the large draw down, it was necessary to borrow funds early in 1983 from the U.S. Treasury until the April-to-June quarterly employer tax contributions were collected after mid-year.

Higher employer contribution rates plus reduced benefit payments permitted the Trust Fund to accumulate a balance of \$96,062,000 at the end of 1983.

Although the immediate threat has passed, it is apparent that the adequacy of the Trust Fund level of funding has been severely tested during the recent recession years.

Since the balance between employer contribution rates and unemployment benefit obligations had been conservatively managed for many years, this was the first time the Division has borrowed funds from the Federal government -- and then only after several years of exceptionally heavy claims payments.

In efforts to prevent the necessity of borrowing again, the Advisory Council to the Employment Security Board established a task force to study the financing of the unemployment insurance trust fund. In order to gain a more historical perspective, the Employment Security Board also commissioned Professors Mikesell and Zorn of Indiana University's Department of Economics to prepare a long-range study of the trust fund financing.

Because of the serious implications of a trust fund in default, the General Assembly also established an interim study committee on unemployment compensation. The legislative committee is bi-partisan and made up of members of both houses.

For more information and copies of reports, studies and related activities concerning the unemployment trust fund, you may call (317) 232-7704.

ECONOMIC RECOVERY AND JOBS IN THE SEVENTH DISTRICT

BY JERRY SZATAN AND
WILLIAM A. TESTA

The states of the Seventh Federal Reserve District (Illinois, Indiana, Iowa, Michigan, and Wisconsin) suffered employment losses of over five percent (683,000 jobs) during the economic downturn of 1981-82. This compares with a three

percent national decline. During the short but sharp recession of 1980, District states' employment fell by three and one-half percent compared with one percent nationally. Between these recessions the 1980-81 national recovery never materialized in the Seventh District; Indiana alone recorded an employment increase during this period. The Seventh District endured, in effect, a single long and deep recession over the years 1980 to 1982.

The economies of the states that make up the Seventh Federal Reserve District are in transition.

Public and private sector studies dealing with Midwestern economic troubles have largely focused upon describing and understanding the nature and causes of economic change within the region. The studies frequently cite the following problems: high wages, declines in productivity, unionization, foreign competition, high energy prices, low levels of federal spending, and weaknesses in the farm economy. Based on these findings, economic development groups on both state and local levels are beginning to formulate programs and policies intended to bring about a revitalization in state and local economies.

(Excerpt from accompanying commentary to article)

The United States is now enjoying rapid economic growth, with gross national product (GNP) increasing at above average rates for this stage of a recovery, and falling unemployment rates. Due to the severity of the economic decline in the Seventh District, the extent to which the District shares in this national recovery is critical in assessing the prospects for reemploying the District's labor force. This article provides a perspective on this issue by examining employment changes in the Seventh District from 1969 to the present against the backdrop of national economic trends. The current expansion in the District states is described and compared to historical national and regional upturns to aid in assessing the outlook for job growth in the months and years ahead.

Employment growth 1969 to 1984

Although the roots of Midwestern economic decline can be traced prior to the 1970s, job growth in the older industrial heartland has only markedly lagged the nation over the last ten years. During the national wartime economy of the 1960s, rapid economic expansion masked a long-term decline in many older manufacturing areas, including several Seventh District states. Subsequently, slower national growth and increasing foreign competition in manufacturing revealed the long-running erosion in many basic midwestern industries. Only a surge in farm income can be identified as a significant countervailing trend to midwestern decline in the 1970s.¹

¹ Average yearly total net farm income in the U.S. increased nearly a quarter from the 1960s to the 1970s. To date, income in each year of the 1980s has fallen far short of the 1970s average.

From the fourth quarter of 1969, the peak of the 1960s expansion, to the second quarter of 1984, employment in the nation grew approximately 32 percent, compared with less than 9 percent in the Seventh District (Table 1). Much of this relative decline reflects the sagging state of basic manufacturing industries nationwide (Table 2). Because manufacturing comprises a greater share of total non-agricultural employment in the District than in the United States (25.3 percent compared with 20.9 percent in 1984:II), the generally shared decline in manufacturing employment had a disproportionately greater effect on total employment in the District.

District manufacturing employment also lost ground relative to other regions of the United States, aggravating the area's employment decline. The percentage decrease in manufacturing employment in the Seventh District was 20 percent between 1969 and 1984, over seven times greater than in the United States.

Although the overall story of Seventh District employment is one of relative decline, there are notable differences among the states. Job expansion in both Iowa and Wisconsin substantially exceeded Illinois, Indiana, and Michigan over the 1969-

Figure 1
Index of quarterly employment in the U.S. and Seventh District States

Figure 2

Index of quarterly manufacturing employment in the U.S. and Seventh District states

index (1969 Q4 = 100)

1984 period (Figure 1). Total employment increased by over 17 percent in Iowa and by over 23 percent in Wisconsin compared with the District average of 8.6 percent. In fact, below-average employment growth in Iowa and Wisconsin, relative to the United States, dates only from the first quarter of 1980. Until then, employment growth in these states had matched or exceeded the national rate.²

Manufacturing employment in District states exhibits a similar pattern. Manufacturing jobs over the 1969-1984 period decreased much less in Iowa and Wisconsin than in the remaining District states (Figure 2). Once again, Iowa's and Wisconsin's trouble dates from the first quarter of 1980. Between 1969 and 1980, manufacturing employment grew more in Iowa and Wisconsin than in the United States. In sharp contrast, manufacturing employment declined in the District states of Michigan, Illinois, and Indiana from 1969 onward, increasingly falling behind manufacturing employment in the United States.

2 One factor in this favorable performance was the strength of the farm economy during the 1970s. Industries such as food processing and farm equipment are important sectors of Iowa's and Wisconsin's economies.

Employment change and the business cycle: 1969 to 1984

Another perspective on the Seventh District's relative long-term employment decline is provided by examining its percentage change in employment relative to the nation in periods of national expansion and contraction. Total employment losses have been greater in the District than in the United States during every recession between 1969 and 1984 (Table 3). This has also been true for every state in the District in every recession, except for Iowa in 1969-70 and Iowa and Wisconsin in 1973-75.

A greater-than-national drop in employment during a recession

will not result in a region's long-term decline if cyclical downturns are offset by greater-than-national employment gains during expansions. Unfortunately, this has not been the case in the District in recent years. During the expansion of 1970-73 employment growth in every District state except Illinois exceeded the nation. But in the recovery period from 1975 to 1980, employment grew less in every District state than in the nation, although Wisconsin almost equaled the national rate.

This poor performance worsened in the early 1980s. During the short-lived national recovery of 1980-81, not only did the rate of national employment gain exceed the rate in every District state, but every state except Indiana actually continued to lose employment.

For the most part, first quarter 1980 through fourth quarter 1982 comprised a single long, deep recession in the District. Job losses in Seventh District states ranged from 6.8 percent in Wisconsin to 11.9 percent in Michigan, while employment in the nation declined by only 2.4 percent. By November of 1982, the recession's trough, unemployment measured 13 percent in the District compared with 10.4 percent in the United States. State unemployment rates in the District ranged from 8.5 percent in Iowa to 16.4 percent in Michigan -- the highest in the nation.

Economic recovery 1982-1984

Beginning in the fourth quarter of 1982, economic recovery began to pull national employment out of its slide. By the second quarter of 1984, employment in the United States stood 5.7 percent above its level at the recession's trough. However, among Seventh District states, only Michigan's employment recovery coincided with the nation's recovery with every other state lagging the national recovery (Figure 3).³ Employment continued its slide for two quarters into the national recovery in Indiana and Iowa and three quarters in Illinois.

Districtwide employment is now up 2.5 percent after six quarters of recovery but this is less than one-half the national growth for the same period. Among District states, only Michigan's employment gain of 5.1 percent approaches the nation's gain of 5.7 percent. Employment growth in Iowa and Illinois, .2 percent and 1 percent, respectively, has been especially weak.

Because current employment growth in most District states has been slower than the national rate and because employment loss was more pronounced in the Midwest from 1980 to 1982, expansion time needed to regain previous levels of District employment will be greater than in the past. By the fourth quarter of 1983, the national economy had surpassed its previous employment peak (91.4 million jobs), which it had reached during the third quarter of 1981. In contrast, if the Seventh District employment growth continues at the average quarterly pace of the fourth quarter 1982 to second quarter of 1984, the third quarter 1981 employment level will not be

3. The state and U.S. mean historical employment indices were constructed by averaging the individual index levels over the 1970-73, 1975-80, and 1980-81 national recoveries. Note that the 1980-81 recovery was truncated after 4 quarters so that, beyond this point, the mean historical recovery represents averages of the 1970-73 and the 1975-80 recoveries.

Figure 3
**Total employment: Recovery patterns in the Seventh District states
 and the U.S. Historical recovery (1970, 1975, 1980*) vs. current recovery**

Index: Employment in each trough = 100.

*Recovery from 1980 trough lasted four quarters. Mean after four quarters does not include post-1980.

regained until after the first quarter of 1986. The level of employment recorded in the first quarter of 1980, 13.78 million jobs, would not be reached until the end of 1988.

Despite the weak rates of employment growth during the current recovery, the historical pattern of economic recovery and expansion in the region suggests that continued national recovery will accelerate the pace of District employment growth relative to the U.S.⁴ With the exception of Illinois, the average employment growth rate in each District state over the 1970-73, 1975-80, and 1980-81 national expansions reveals some modest gain on the national rate of growth as expansion extends into the fifth and sixth quarters and beyond (Figure 3). While it is unlikely that previous District employment levels will be quickly regained due to this acceleration, the current rate of economic recovery in the states of Indiana, Iowa, and Wisconsin probably understates the near-term employment outlook.

Conclusions

Led by a faltering manufacturing sector, the Seventh District economy has continued to decline relative to the nation over the 1969-84 period. In recent years, weak employment growth in the region during national economic expansion gives evidence of an acceleration of regional decline. Regional employment growth trailed the nation during the 1975-80 expansion and it continues to lag during the current recovery. Meanwhile, recovery in this District never materialized during the short-lived national recovery in 1980-1981 so that District employment declines from 1980 to 1982 are staggering. A continuation of economic expansion in the District at the current pace would not regain these jobs until 1988. The economies of every District state, except Illinois, have displayed a modest historical tendency to accelerate relative to the nation as the expansion extends into the second year. However, the District's employment growth rate would have to substantially exceed the national rate if job losses of the early 1980s are to be recouped in the near future.

4. Of course, no two recoveries can be expected to be identical because many other conditions such as trade policies, secular industry trends and government support programs greatly differ from time to time. Still, national cyclical behavior and its regional components display some fairly consistent behavior. For example, capital goods industries tend to "kick in" to national recovery after the first year as manufacturing firms begin to invest in plant and equipment. This has accounted for late-recovery employment acceleration in states with large capital goods industries such as Wisconsin.

Elkhart -- positioned for growth

The recovery of the Elkhart economy during the last two years has been dramatic. Payroll employment rose 16,900 from November 1982 to 86,900 in November 1984. As strong sales demand for recreational vehicles and van conversions returned, this industry has expanded, as well as related furniture, textile and rubber products industries.

3 CASES --

WORKING TOWARD VIABLE LOCAL ECONOMIES

While Indiana and other Midwestern states have seen their durables manufacturing base erode since the early 1970s, some instances can be pointed out in Indiana where local areas are successfully holding their own economically. Some have done so as a result of natural advantages of location or efficient plant systems in place, others by careful planning to make their economic future viable. Here are some examples.

It appears that during the preceding recession years a consolidation and concentration of recreational vehicle manufacturing facilities and services took place in the Elkhart area. When sales demand returned, the area's r-v industries were prepared for rapid expansion, growing to volumes up to that of the 1978 previous peak year and went even higher.

Further, a large share of the 1984 increase in transportation equipment was not in recreational vehicles, but came from new firms and growth in other types of motor vehicles and equipment.

Unlike many areas, Elkhart's ratio of manufacturing employment to nonmanufacturing employment has not changed greatly since 1975.

Currently, about 46 per cent of Elkhart's payroll employment is in nonmanufacturing, near the 45 per cent to 50 per cent ratio of nonmanufacturing to manufacturing employment from 1975 to the present.

High Tech Host

Lafayette has features that tend to make it a good environment for "high tech" companies. Lafayette is a smaller city, whose local economy is stabilized by a large state university, Purdue, which contributes a sizeable portion of the area's employment.

The favorable climate for high technology afforded by proximity to the university's respected engineering school has brought several research and engineering, electronics and computer-related operations to the area.

Manufacturing employment has risen about 8.5 per cent since 1975. While durables manufacturing has very nearly held its own (fell only 4 per cent since 1975), nondurables manufacturing has increased about 39 per cent.

While such traditional local manufacturers as Peerless Wire, Essex Wire and National Homes plants have closed, other operations such as Caterpillar Tractor, Duncan Electric, CTS Microelectronics, and Micro Data Base System have grown and silicon chip maker International CMOS Technology plans to relocate from California.

Nonmanufacturing has increased about 25 per cent since 1975 but has increased its share of local payroll employment only slightly, moving up only 2.2 per cent from 1975 to 80.8 per cent in November 1984. Trade and services now comprise about 45 per cent of nonmanufacturing overall; services has expanded 43 per cent since 1975.

Data indicate that manufacturing basically has held its own in share of local employment since 1975 and that the nonmanufacturing share has not swelled as in many local economies.

New businesses, including some high technology industries, are drawn to locate in Lafayette by the area's advantages, some of which are natural and some of which have been created.

Indianapolis -- planned growth into services

When Indianapolis hosts an assembly of urban leaders from around the world this Spring at the City Assets conference, it will point up the planned progress the city has made in moving from a declining durable goods manufacturing base to a services economy.

Payroll employment in the Indianapolis Standard Metropolitan Statistical Area (SMSA) has continued to climb since 1970 (rising 27 per cent 1970), but the components of the growth have changed.

Local manufacturing peaked in 1973 at 129,500 (annual average) and generally has trended downward since that time to about 109,300 (November 1984), currently. About one out of three workers (30 per cent) were in manufacturing in 1970 and, at present, about one out of five (20 per cent) are manufacturing workers.

By contrast, nonmanufacturing employment has increased about 46 per cent from 1970 to the present (424,400 in November 1984), so that now about four out of five (79.5 per cent) workers are in nonmanufacturing employment.

It didn't just happen and it hasn't been easy to make the transition. Observers have cited a viable leadership combination of local government, community organizations and the private business sector in building an economic development program for the future.

Key points in the plan to grow into a more service-oriented economy include: (1) building convention facilities and developing a thriving convention business, (2) developing a program for hosting major amateur athletic contests, and (3) promoting the city as a national headquarters location for religious, membership and service organizations.

In a number of instances at the City Assets conference, Indianapolis will be a demonstration -- a learning laboratory for a number of ideas and strategies to be studied, which are now in use there.

An official of the sponsoring organization says Indianapolis is an example of a city that has used its human assets well to overcome its lack of natural assets.

CPI GEOGRAPHICAL SERIES

Consumer Price Index -- December 1984

	CPI-W	CPI-U*
U.S. City Average	312.2	315.5
New York	301.6	308.0
Chicago	301.7	314.0
Cincinnati	319.3**	325.4**
St. Louis	307.1**	309.1**
Los Angeles	305.5	311.1

No Consumer Price Index (CPI) is produced by the Bureau of Labor Statistics for Indiana, or any Indiana cities. CPI series for several cities are published, including the ones listed here.

* CPI-U Series, beginning January 1983 changed the way home owner costs are measured to rental equivalence - based on implicit rent owners would have to pay to rent homes they own.

+ Seasonally adjusted per cent change.

** November 1984

1/-Standard Metropolitan Statistical Area

2/-Employment is based on establishment figures, reflecting place of work.

P-Preliminary

Monthly estimates for the State and SMSAs are adjusted to new benchmark data at the end of each year.

TABLE VIII. SUMMARY OF UNEMPLOYMENT INSURANCE ACTIVITIES

Third Quarter 1984

State Unemployment Insurance

	<u>3rd Q. 1984</u>	<u>2nd Q. 1984</u>	<u>3rd Q. 1983</u>	<u>Year-to-date 3rd Q. 1984</u>
New claims	66,600	59,900	71,100	218,400
Additional claims	33,000	31,300	42,500	101,000
Continued weeks claimed	536,200	602,200	676,200	1,982,800
Average claims per week	47,800	51,800	59,300	57,500
Total claims from other states	30,100	28,800	33,200	96,700
Number of claims exhausted	12,800	19,000	23,500	50,000
Number of first payments	35,500	32,000	33,800	124,700
Av. wkly. payment for total unempl.	\$90.80	\$91.00	\$91.00	\$91.50
Number of payments	434,200	492,000	578,100	1,633,000
Amount of payments	\$40,484,300	\$45,604,800	\$51,534,900	\$150,981,100
Benefits not charged to				
employer accounts	\$ 566,900	\$ 672,200	\$ 614,000	\$ 2,136,600
Per cent of all payments	1.4%	1.5%	1.2%	1.4%

Federal Programs (UCFE, UCX)

Initial claims	1,420	1,240	1,840	4,290
Continued weeks claimed	8,600	10,000	10,800	33,700
Av. number of claims per week	800	900	1,000	1,000
Number of payments	7,300	8,800	9,400	30,000
Amount of payments	\$ 738,200	\$ 893,000	\$ 922,000	\$ 3,011,000

Extended Benefit Program

New claims	2	5	90	17
Continued weeks claimed	35	55	1,910	280
Av. number of claims per week	2	4	140	6
Number of payments	25	47	450	192
Amount of payments *	\$ 8,100	\$ 107,400	\$ 190,400	\$ 248,200

Federal Supplemental Compensation

New claims	13,800	17,200	26,500	51,200
Continued weeks claimed	102,000	132,300	254,000	408,000
Av. number of claims per week	8,900	11,500	21,100	11,800
Number of payments	96,600	126,100	233,800	391,900
Amount of payments	\$ 8,162,800	\$10,585,000	\$20,057,800	\$ 32,892,600

* Includes reimbursements to other states.

FIRST QUARTER 1985 SEASONALLY ADJUSTED

INDIANA NONAGRICULTURAL EMPLOYMENT

Statewide nonagricultural establishment employment rose moderately from fourth quarter 1984 to first quarter 1985, and rebounded substantially from first quarter 1984 to first quarter 1985. However, the current level of 2,184,900 was still 70,000 below the record high second quarter 1979.

Manufacturing employment barely edged upward from a quarter ago and only recorded a small gain from the year ago quarter. From the fourth quarter 1984, a loss in durable goods was more than offset by a rise in nondurable goods which produced the mild increase in the first quarter in total manufacturing. The decrease in durable goods between quarters resulted chiefly from a drop in the machinery industries. The slight upturn from a year ago was inhibited by a decline in steel mill production. In the nondurable goods sector, employment growth in plastics products resulted in the upward movement from both 1984 quarters.

Employment additions throughout nonmanufacturing industries accounted for over 90 per cent of the increase in total establishment employment from both a quarter and year ago comparisons. The wholesale and retail trade, services, and contract construction divisions were the prime components in the increases from both previous time spans. Also the present level of nonmanufacturing employment represented a new record high,

Labor Information Systems

Operated by Several Nations

Differ Widely in Scope and Timeliness

The Employment Security Systems consist of Unemployment Insurance and Job Service offices nationwide. They are funded through federal grants to state Employment Security agencies. They produce labor market information as a by-product of their operations.

Frequently overlooked and little understood, the United States system of Labor Market Information (LMI) actually is one of the best programs of its kind in comparison with those of other nations.

Comparison articles published in the January 1985 edition of the IAPES News, the monthly newspaper published by the International Association of Personnel in Employment Security (IAPES), paint a picture of U.S. excellence in labor market information.

Labor information bureaus from Canada, Denmark, the Federal Republic of (West) Germany, Great Britain, Israel, Japan and United States, summarized their programs.

The use of a total labor market concept was one of America's prime strengths. So, too, was the frequency the data are collected and released, most often on a monthly basis. In some nations, data are as much as two years old on release.

Coordinated by the Bureau of Labor Statistics, the United States system also includes State Employment Security agency LMI programs, Census Bureau and Department of Commerce data. It surveys both individuals and employers. It differentiates between jobs and people. It publishes statistics on local areas as well as the nation. The U.S. LMI program has been particularly helpful in the installation of training programs under the Job Training Partnership Act.

The other nations have varying degrees of sophistication in their LMI programs. Canada is most like the U.S., although several agencies produce the information. Its methods are similar. Denmark is interesting in that the data base is provided by an employers' association. Only those on unemployment benefits or social assistance are counted as unemployed. The labor force is surveyed but once a year, and that information is available a couple of years later.

West Germany only counts as unemployed those registered with the local employment offices, and the labor force is determined by those covered by social security and unemployment insurance. The types of reports are similar to the U.S.

It does produce an annual report on the structure of unemployment, and employers are required each 12 months to report significant changes in the labor force. Great Britain conducts a lot of surveys and studies, but it is reducing the number, apparently due to financial constraints and a redirection in the use of labor market information.

Japan uses its LMI data to plan employment intervention strategies. Israel is unique in that almost all its labor force is required to register with the state employment offices. It does not have to survey the labor force, it has total records.

Editorial Comment:

Even if the labor market information system in the U.S. is the best system in the world, it is not worth a nickel if it is "overlooked and little understood." The contents of this publication are labor market information. Are any of the contents understood and used? The best, if not the only, answer to that must come from the reader.

However, it is my job to see that labor market information is not overlooked, and that it is understood so that its intrinsic value can be realized. And that value is somewhat more than a nickel!

Perhaps it is best to begin at the beginning. Just what is labor market information? The labor market, like any other market, is a place where things are bought and sold. The place can be any of a number of locations, e.g., a Job Service office, a college placement office, a union hiring hall, the classified ads, the personnel office, two people talking anywhere about employing and being employed. The item being bought and sold is labor (work, a job).

Information is the result of the communication or the reception of knowledge or intelligence.

Therefore, labor market information is simply communicating or receiving knowledge about the buying and selling of work. Even though the definition is simple, the labor market itself and labor market information can become complex. It can be as complex and as diverse as the needs of the individuals who use it.

As I mentioned above, the contents of this publication are labor market information. Are the contents understandable? Do the contents have some value to you? Or, is this publication mostly overlooked, not even looked over? Unfortunately, if it is completely overlooked you won't be reading this.

However, just in case someone is reading this, I have a request. Please let me know if what you read in the TRENDS is of value to you. How can the value be increased?

Charles N. Mazza
Labor Market Information
and Statistical Services

Geographical Area Changes Cause
Break in Historical Comparability

The office of Federal Statistical Policy and Standards in the U.S. Department of Commerce has announced changes in the Metropolitan Statistical Area classifications (formerly called Standard Metropolitan Statistical Areas). As a result, some of the MSAs' titles and/or geographical area definitions have been changed. These revisions arise from population changes recorded in the 1980 Census, the basis for MSA area definitions.

MSAs with new area definitions include:

Evansville MSA (Dropped Gibson Co.)
Posey Co., Vanderburgh Co., Warrick Co., Henderson Co., Ky.

Fort Wayne MSA (Dropped Adams Co., Wells Co.)
Allen Co., DeKalb Co. Added Whitley Co.

New Albany Area
Clark Co., Floyd Co. Added Harrison Co.

South Bend-Mishawaka MSA (Dropped Marshall Co.)
St. Joseph Co.

Terre Haute MSA (Dropped Vermillion Co., Sullivan Co.)
Clay Co., Vigo Co.

These new geographical area definitions produce a major break in comparability of the series historical continuity. Historical data for 1983 and 1984 will be published for the MSA definitions.

This is a break in the series and will cause the historical series for SMSAs to stop with the 1982 estimates, and the historical series for MSAs to begin with January 1983. No comparable data for any overlapping years or definitions will be available.

Area definitions for these MSAs remain
the same as under the previous SMSA definitions:
Consequently, data for these areas remain com-
parable to SMSA data for previous years.

CPI GEOGRAPHICAL SERIES

Consumer Price Index — March 1985

	CPI-W	CPI-U*
U.S. City Average	315.3	318.8
New York	304.2	310.9
Chicago	304.7	317.4
Cincinnati	322.2	328.4
St. Louis	311.0	314.3
Los Angeles	309.8	314.7

No Consumer Price Index (CPI) is produced by the Bureau of Labor Statistics for Indiana, or any Indiana cities. CPI series for several cities are published including the ones listed here.

*CPI-U Series, beginning January 1983 changed the way home owner costs are measured to rental equivalence — based on implicit rent owners would have to pay to rent homes they own.

+ Seasonally adjusted per cent change.

Labor force data are based on place of residence and include all types of employment: non-agricultural wage and salaried, self-employed domestics and farm workers.

Does not add due to rounding. (P-Preliminary)

Monthly estimates for the State and MSAs are adjusted to new benchmark data at the end of each year.

*Not published to avoid disclosure of individual firm data.

Covered Employment includes employees working for firms subject to the Indiana Employment Security Act. The Act, in general, includes employers with one or more employees. Excluded are railroads, small non-profit institutions and churches. Beginning with January 1, 1978, all state and local government employment, including that in schools, is covered. Accredited private and parochial school employment is also covered. However, only part of the employment in private households and on farms is included in the expanded coverage.

Average weekly earnings are computed from the quarterly earnings and average employment of all employees in establishments covered by the Act. The figures are computed from total payrolls so they include all employees--janitors, company officers, factory workers, office employees--instead of only production workers. The new coverage in 1978 affects the all covered employment average so these averages are discontinuous from those calculated for prior years.

Indiana Labor Market

2ND QUARTER 1985

TRENDS

Explanatory Note

This publication of Trends utilizes employment data of two types, both by place of work. Below, you will find a brief explanation of each.

Covered Employment. Covered Employment is employment that is covered by unemployment insurance under the Indiana Employment Security Act. As of 1978, Covered Employment represents about 96 per cent of Establishment Employment and 89 per cent of all employment. Major exceptions to coverage are railroad employment, very small non-profit institutions, churches, most private household workers, the majority of employed students in colleges universities, a sizable portion of hired agricultural workers, Federal civilian employees, workers on strike, and all self-employed individuals including farmers.

Establishment Employment. Establishment Employment includes almost all Covered Employment. Railroad employment, very small non-profit institutions, churches, employed students in colleges and universities, agricultural service workers, Federal government civilian employees, and workers on strike are added. Excluded are all private household workers and all self-employed individuals including farmers.

INDIANA NONFARM EMPLOYMENT RISES SLIGHTLY

DURING SECOND QUARTER 1985

Statewide nonagricultural establishment employment (seasonally adjusted) increased slightly from first to second quarter 1985. It also rose moderately from second quarter 1984 to second quarter 1985. However, the present level was still more than 60,000 less than the record high second quarter 1979. The good news was the loss from the old level was subsiding.

Establishment employment recorded a recessionary low of 2,000,800 in the first quarter 1983. Since the initial quarter 1983, employment has risen in each subsequent quarter to the current amount of 2,193,300. The nine successive quarterly gains have added back 192,500 jobs to wage and salaried employment.

Manufacturing employment failed to grow from both the quarter before and year ago quarter. Durable goods employment fell by almost the same amount from both time comparisons. From first quarter 1985, most durable goods industries showed small losses which were led by electrical machinery and transportation equipment. From a year ago quarter, declines in electrical machinery and primary metals kept the change in total durable goods employment on the minus side.

In nondurable goods, over the quarter, most industries reported small losses. From second quarter 1984, an overall rise was recorded primarily from growth in plastics products and the printing industry.

Almost all nonmanufacturing industries gained employment from both the previous quarter and year ago quarter. Services, construction and retail trade were the prime industry components leading the gains from the first quarter. Since the second quarter 1984, trade, services, and construction have accounted for 84 per cent of the total nonmanufacturing gain.

Employment Security Law Amended

BENEFIT AMOUNTS, CONTRIBUTION RATES RAISED, BUT EARNINGS REQUIREMENTS TIGHTENED, BY 1985 GENERAL ASSEMBLY

Several changes to Indiana's Employment Security law were enacted by the 1985 General Assembly.

The maximum "contribution" rate in each of seven tax schedules was raised to 5.4 per cent to conform with Federal regulations. The change is retroactive to January 1, 1985. The rate for new employers still is 2.7 per cent of the first \$7,000 paid in wages for each employee. Formerly the state's highest penalty rate was 4.5 per cent. The lowest rate remains at 1.3 per cent.

Other legislation raises the maximum weekly benefit amounts (for the first time since 1980) about 7 per cent in each of the next two years but tightens earnings requirements to qualify for benefits.

The new amounts are:

	Current	Week of July 7, 1985	Week of July 6, 1986
single	\$ 84	\$ 90	\$ 96
1 dependent	99	106	113
2 dependent	113	121	129
3 dependent	128	137	147
4 dependent	141	151	161

For claims filed after July 7, 1985 claimants must earn at least \$2,500 in their base period; \$1,500 of which must have been earned in the last ~~two~~ quarters (formerly \$1,500 with \$900 in last half); and total base period earnings must be at least 1.5 times the high quarter wages (formerly 1.25).

New legislation also establishes a six-member Indiana Occupational Information Coordinating committee to be housed with the Division.

Also, mandates that at least one of the three members of the Indiana Employment Security Review Board be an attorney. Specifies that the Review Board shall mail with their decisions a notice of appeal rights and the responsibility of the interested persons that they must request a transcript in order to perfect the appeal. Specifies that the charge for transcripts shall be a uniform average fee that will be paid in advance of preparation.

In addition, repeals the state tax credit program for training the hard core unemployed, and re-authorizes the Employment Security Division Boards and Advisory Councils.

SPECIAL STUDY

GARY-HAMMOND PMSA STEEL MILL
EMPLOYMENT LOSSES NOT AS DAMAGING
AS ELSEWHERE

by Lillian Miles
Labor Market Analyst
Gary-Hammond PMSA

STEEL -- for many parts of the country, it is simply defined as a basic manufacturing industry.

STEEL, for specific areas of the country however, is the backbone of the local economy.

The Gary-Hammond PMSA's economic survival, is and always has been, extremely affected by the activity in the area's steel mills.

In 1979, the last good employment year in this area, steel mill employment was 66,600. During the recessionary years of 1980 to the present, changing conditions have had a most devastating effect on the steel industry. The annual average for 1984 in steel mill employment was 43,100 -- a loss of 23,500 from 1979. While that drop -- approximately 35 per cent -- has had adverse effects on the local economy, one question rises, just how does this steel area compare with others in the nation? Have other areas experienced similar or more greivous declines?

The following information was gathered for the purpose of examining nationwide steel mill employment and relating/comparing changes which have occurred since 1980.

While the study is not meant to downplay the local area's steel mill problems, perhaps, it does give a broader perspective to the local position versus other areas, which are also very dependent on steel.

One criteria used when developing the data was that employment in the steel mill industry for any area must be at least 10,000. That basis eliminated various areas of the country leaving 10 areas for the study. The areas were then ranked by their employment level as of 1980.

In 1980, the nation's steel mill employment in blast furnaces and basic steel making was 511,900. The ten areas in this study accounted for 271,700 or 53.1 per cent of that total.

By 1984, some very dramatic shifts in the national economy had transpired, and steel mill employment on the national level was 336,700 -- a loss of 175,200 or -34.2 per cent during the five year period. At the same time, the steel mill employment in the 10 areas had dropped to 163,900 -- an erosion of 107,800 (-39.7 per cent). These 10 areas' losses represented 61.5 per cent of the national decline.

There are three statistical displays accompanying this analysis. The first will list annual average employment in the steel mill industry for the years 1980 through 1984 inclusive. The second table will show the annual change in employment -- year to

year -- as well as 1980 to 1984. The final table shows the unemployment rates for the United States and the 10 areas from 1980 to 1984 inclusive.

Even though local steel mill employment began to decline in 1980 compared to 1979, this area was listed as the number one steel producer/employer in the nation. The Pittsburgh area was second with employment at 56,500 -- 4,100 workers less than employed here (60,600).

By 1984, the Gary-Hammond PMSA was still number one with employment at 43,100, but the gap over the Pittsburgh area (still #2) had widened drastically -- now 13,800.

When reviewing the following tables, it is interesting to note several items:

1. In 1980, the 10 areas accounted for 53.1 per cent of the national steel mill employment.
2. By 1984, these same areas had a 48.7 per cent share of the national steel mill employment level.
3. The largest numerical decline in employment occurred in Pittsburgh -- losing 27,200 from 1980 to 1984.
4. The largest percentage decline was in Beaver County, PA., -- falling 60 per cent during the five year period.
5. Steel mill employment experienced its largest drop between 1981 - 1982. The national decline was 109,900. The 10 areas reported a loss of 59,900 or 54.5 per cent of that total loss.

So, it would seem, that while this area has experienced "problem times" in the local steel mill industry, other areas, which are equally dependent on that industry, are much worse off.

When looking at the unemployment rates as shown on Table 3, the peak years of unemployment on the national level were 1982 and 1983 -- with a rate of 9.7 and 9.6 respectively.

That is the same time period when the Gary-Hammond PMSA hit its highest level of unemployment -- 15.7 per cent for both years. Also during the years 1980 - 1984, this area outpaced the State rate each year. In fact, for 1984, this PMSA was the only Metropolitan Statistical Area in Indiana which continued to report double digit unemployment.

As high as our local unemployment was however, for the year 1982, the highest unemployment rate within the 10 areas of the study was in the Youngstown/Warren, PA., area -- 19.7 per cent.

And, in 1983, the area which sported the highest unemployment rate was Beaver County, PA., -- 21.0 per cent of the labor force.

While it is expected that locally there will still be additional losses in steel mill employment, it would seem logical to assume that the worst is behind us.

One thing that should be kept in mind however, is that 1986 is the year when the steelworkers will begin to renegotiate with the steel-makers on a new contract. What transpires will have a long lasting impact on this area as well as those which were included in the study.

	CPI-W	CPI-U*
U.S. City Average	318.7	322.3
New York	306.3	313.2
Chicago	310.9	324.1
Cincinnati	324.0**	330.4**
St. Louis	313.0**	315.9**
Los Angeles	314.1	319.3

No Consumer Price Index (CPI) is produced by the Bureau of Labor Statistics for Indiana, or any Indiana cities. CPI series for several cities are published including the ones listed here.

*CPI-U Series, beginning January 1983 changed the way home owner costs are measured to rental equivalence - based on implicit rent owners would have to pay to rent homes they own.

+ Seasonally adjusted per cent change.
** May 1985

Labor force data are based on place of residence and include all types of employment: non-agricultural wage and salaried, self-employed domestics and farm workers.

Does not add due to rounding. (P-Preliminary)
Monthly estimates for the State and MSAs are adjusted to new benchmark data at the end of each year.

NOTE:

1. Employment is based on establishment reports, reflecting place of work.
2. Employees not working due to involvement in labor-management disputes are excluded.
3. Monthly estimates for the State and SMSA's are adjusted to a new benchmark at the end of each year. The 1984 annual averages and the 1985 monthly data reflect the 1984 benchmark.

1/ Metropolitan Statistical Area

2/ Employment is based on establishment figures, reflecting place of work. *Disaggregated rubber and plastics from all other nondurables.

3/ Aggregated apparel and textiles with all other nondurables in 1981.

4/ Disaggregated chemicals from all other nondurables in 1981.

5/ 1983 and 1984 data revised to new Metropolitan Statistical Area geographical definition. Data not comparable with that of previous years.

6/ P/ Preliminary. Monthly estimates for the State and MSAs are adjusted to new benchmark data at the end of each year.

Covered Employment includes employees working for firms subject to the Indiana Employment Security Act. The Act, in general, includes employers with one or more employees. Excluded are railroads, small non-profit institutions and churches. Beginning with January 1, 1978, all state and local government employment, including that in schools, is covered. Accredited private and parochial school employment is also covered. However, only part of the employment in private households and on farms is included in the expanded coverage.

Average weekly earnings are computed from the quarterly earnings and average employment of all employees in establishments covered by the Act. The figures are computed from total payrolls so they include all employees--janitors, company officers, factory workers, office employees--instead of only production workers. The new coverage in 1978 affects the all covered employment average so these averages are discontinuous from those calculated for prior years.
